

Pioneering Excellence in **MULTI-CLOUD INTEGRATION** for the U.S. Air Force

The Customer

Hanscom Network Integration (HNI), a pivotal organization within the U.S. Air Force, specializes in network integration, technological advancements, and strategic communication solutions. With a mission centered on enhancing communication capabilities, ensuring network security, and supporting the overarching objectives of the Air Force, HNI stands at the forefront of driving technological innovation and operational excellence within the defense sector.

The Challenge

The Air Force embarked on the Cloud One initiative to centralize its cloud operations and provide overarching support for applications across all global bases.

However, the initiative faced significant challenges due to Cloud One limited capability in supporting only specific cloud onboarding processes without offering application modernization tools.

This lack of end-to-end cloud acquisition and solution support, coupled with deficiencies in automation, security, and performance assessment, presented considerable obstacles.

Bases struggled with assessing application readiness for cloud migration due to insufficient security evaluation functionality. Additionally, the absence of cloud engineering personnel overseas hindered the ability to independently navigate security protocols and usage issues, leading to inconsistencies in cloud versions across the Air Force, which undermined the goal of a unified cloud infrastructure.

THE SOLUTION

RoarTech's CEO was a crucial Technical Advisor on the procurement process and market research. From writing the RFI, helping the government address its problems, and later on reviewing the answers to it, RoarTech created a system for scoring the potential vendors, and helped shortlist the companies eligible for the RFP phase.

Facilitated hosting across multiple hybrid clouds, offering enhanced flexibility and resilience in IT operations, while also providing capabilities for swift and reliable data transfers from cloud to cloud, ensuring operational continuity and agility within the environment.

Implemented cutting-edge technologies and streamlined the cloud process and implementation to increase overall productivity and efficiency, and enhance user-friendliness, allowing personnel of varied qualifications to effectively manage cloud necessities with minimal oversight.

Achieved significant operational cost savings through strategic IT solutions, including data center consolidation and application rationalization, improving the affordability of IT services while also setting a solid foundation for future advancements, adopting innovative technologies such as cloud computing and application rationalization,

RoarTech Inc. served as a key advisor to the client, leading the Compute and Storage efforts from the government side, ensuring alignment with the goals, Statement of Objectives (SOO), and specific outcome-driven solutions, thereby enhancing the quality of solutions provided by vendors.

RoarTech helped to simplify the process and the implementation, trying to make it as simple as possible so the users would only need to monitor and register data in order for the application to work, enabling less qualified personnel to perfectly handle the cloud necessities of their respective bases.

THE BENEFITS

Through RoarTech Inc's strategic advisory, comprehensive support, and innovative solutions, the client received unparalleled benefits in architecture and advisory support, vendor solution validation, program management, operational support, security enhancements, metrics and reporting, strategic planning, and enterprise architecture development, significantly advancing their IT capabilities and operational efficiency.

Scalability and Flexibility

Enhanced scalability of IT operations to meet dynamic mission requirements, ensuring seamless operational readiness.

Advanced Security and Performance

Implementation of advanced cybersecurity measures and performance assessment tools to protect and optimize network and data integrity.

Innovative Technology Adoption

Leveraging the latest in cloud computing, application rationalization, and data consolidation to drive efficiency and productivity.

Cost Efficiency

Achieving more affordable operational costs through strategic data center consolidation and application rationalization, improving the reliability and availability of IT services.
